Errors	Amount
11 internal links are broken	11
About this issue: Broken internal links lead users from one webpage to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website.	0
How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.	
3 incorrect pages found in sitemap.xml	3
About this issue: A sitemap.xml file makes it easier for crawlers to discover the pages on your website. Only good pages intended for your visitors should be included in your sitemap.xml file. This error is triggered if your sitemap.xml contains URLs that: - lead to webpages with the same content - redirect to a different webpage - return non-200 status code Populating your file with such URLs will confuse search engines, cause unnecessary crawling or may even result in your sitemap being rejected.	0
How to fix: Review your sitemap.xml for any redirected, non-canonical or non-200 URLs. Provide the final destination URLs that are canonical and return a 200 status code.	

Errors	Amount
1 page returned a 4XX status code About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: - DDoS protection system - Overloaded or misconfigured server How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: - Contact your web hosting support team - Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt	1 0
1 issue with incorrect certificate name About this issue: If the domain or subdomain name to which your SSL certificate is registered doesn't match the name displayed in the address bar, web browsers will block users from visiting your website by showing them a name mismatch error, and this will in turn negatively affect your organic search traffic. How to fix: Contact your website administrator and ask them to install the correct certificate. Since subdomains also require their own certificates, you can use a wildcard or multi-domain SSL certificate that allows you to secure multiple subdomains.	1 0
1 page has multiple canonical URLs About this issue: Multiple rel="canonical" tags with different URLs specified for the same page confuse search engines and make it almost impossible for them to identify which URL is the actual canonical page. As a result, search engines will likely ignore all the canonical elements or pick the wrong one. That's why it is recommended that you specify no more than one rel="canonical" for a page. How to fix: Remove all canonical URLs except the one that you'd like to serve as the actual canonical page.	1 0

Warnings

Warnings

Project name: ruqyacenter.com

Warnings	Amount
25 issues with unminified JavaScript and CSS files	25
About this issue: Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article .	0
How to fix: Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.	
23 external links are broken	23
About this issue: Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website.	0
How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.	

Warnings	Amount
23 pages have low text-HTML ratio About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.	23 0
21 pages don't have meta descriptions About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users. For more information, please see these articles: Create good titles and snippets in Search Results and On-Page SEO Basics: Meta Descriptions How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.	21 0
11 pages have a low word count About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.	11 0

Warnings	Amount
2 pages don't have an h1 heading About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly. How to fix: Provide a concise, relevant h1 heading for each of your page.	2 0
1 page has duplicate H1 and title tags About this issue: It is a bad idea to duplicate your title tag content in your first-level header. If your page's <title> and <h1> tags match, the latter may appear over-optimized to search engines. Also, using the same content in titles and headers means a lost opportunity to incorporate other relevant keywords for your page. For more information, please see this Google article How to fix: Try to create different content for your <title> and <h1> tags.	1 0
1 subdomain doesn't support SNI About this issue: One of the common issues you may face when using HTTPS is when your web server doesn't support Server Name Indication (SNI). Using SNI allows you to support multiple servers and host multiple certificates at the same IP address, which may improve security and trust. How to fix: Make sure that you web server supports SNI. Keep in mind that SNI is not supported by some older browsers, which is why you need to ensure that your audience uses browsers supporting SNI.	1 0
0 external images are broken	0 0
0 links on HTTPS pages lead to HTTP page	0 0
0 pages don't have enough text within the title tags	0 0
0 pages have too much text within the title tags	0 0

23 links on this page have no anchor text

23

About this issue:

0

The issue is triggered if a link (external or internal) on your site has an empty or naked anchor (i.e., just a URL), or anchor text only contains special characters. This issue makes it difficult for the crawlers to understand what the page is about and affects the performance of the linked-to page in search results.

How to fix:

Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about. Also, use short but descriptive text. [Learn more](#)

5 orphaned pages in sitemaps

5

About this issue:

0

An orphaned page is a webpage that is not linked to internally. Including orphaned pages in your sitemap.xml files is considered to be a bad practice, as these pages will be crawled by search engines. Crawling outdated orphaned pages will waste your crawl budget. If an orphaned page in your sitemap.xml file has valuable content, we recommend that you link to it internally.

How to fix:

Review all orphaned pages in your sitemap.xml files and do either of the following:

- If a page is no longer needed, remove it
- If a page has valuable content and brings traffic to your website, link to it from another page on your website
- If a page serves a specific need and requires no internal linking, leave it as is

2 subdomains don't support HSTS

2

About this issue:

0

HTTP Strict Transport Security (HSTS) informs web browsers that they can communicate with servers only through HTTPS connections. So, to ensure that you don't serve unsecured content to your audience, we recommend that you implement HSTS support.

How to fix:

Use a server that supports HSTS.

Detailed Issue: Errors

Detailed Errors

4xx errors

Project name: [ruqyacenter.com](#)

Detailed Issue Description

About this issue:

A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons:

- DDoS protection system
- Overloaded or misconfigured server

How to fix:

If a webpage returns an error, remove all links leading to the error page or replace it with another resource.

To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page.

If the links reported as 4xx do work when accessed with a browser, you can try either of the following:

- Contact your web hosting support team
- Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt

Incorrect pages found in sitemap.xml

Detailed Issue Description

About this issue:

A sitemap.xml file makes it easier for crawlers to discover the pages on your website. Only good pages intended for your visitors should be included in your sitemap.xml file.

This error is triggered if your sitemap.xml contains URLs that:

- lead to webpages with the same content
- redirect to a different webpage
- return non-200 status code

Populating your file with such URLs will confuse search engines, cause unnecessary crawling or may even result in your sitemap being rejected.

How to fix:

Review your sitemap.xml for any redirected, non-canonical or non-200 URLs. Provide the final destination URLs that are canonical and return a 200 status code.

Broken external links

Detailed Issue Description

About this issue:

Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded.

Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website.

How to fix:

Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource.

If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

Low text to HTML ratio

Detailed Issue Description

About this issue:

Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less.

Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results.

Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix:

Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

Missing meta description

Detailed Issue Description

About this issue:

Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users.

For more information, please see these articles: [Create good titles and snippets in Search Results](#) and [On-Page SEO Basics: Meta Descriptions](#)

How to fix:

In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

Low word count

Detailed Issue Description

About this issue:

This issue is triggered if the number of words on your webpage is less than 200.

The amount of text placed on your webpage is a quality signal to search engines.

Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.

For more information, please view [this video](#)

How to fix:

Improve your on-page content and be sure to include more than 200 meaningful words.

Missing h1

Detailed Issue Description

About this issue:

While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly.

How to fix:

Provide a concise, relevant h1 heading for each of your page.

Page URL	Discovered

Makaleler ruqyacenter.com https://ruqyacenter.com/tr/makaleler/	Jul 16, 2026 (15:33) new

Duplicate content in h1 and title

Detailed Issue Description

About this issue:

It is a bad idea to duplicate your title tag content in your first-level header. If your page's <title> and <h1> tags match, the latter may appear over-optimized to search engines.

Also, using the same content in titles and headers means a lost opportunity to incorporate other relevant keywords for your page.

For more information, please see [this Google article](#)

How to fix:

Try to create different content for your <title> and <h1> tags.

No SNI support

Detailed Issue Description

About this issue:

One of the common issues you may face when using HTTPS is when your web server doesn't support Server Name Indication (SNI). Using SNI allows you to support multiple servers and host multiple certificates at the same IP address, which may improve security and trust.

How to fix:

Make sure that you web server supports SNI. Keep in mind that SNI is not supported by some older browsers, which is why you need to ensure that your audience uses browsers supporting SNI.

Detailed Notices

Links with no anchor text

Project name: ruqyacenter.com

Detailed Issue Description

About this issue:

The issue is triggered if a link (external or internal) on your site has an empty or naked anchor (i.e., just a URL), or anchor text only contains special characters. This issue makes it difficult for the crawlers to understand what the page is about and affects the performance of the linked-to page in search results.

How to fix:

Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about. Also, use short but descriptive text. [Learn more](#)

Orphaned sitemap pages

Detailed Issue Description

About this issue:

An orphaned page is a webpage that is not linked to internally. Including orphaned pages in your sitemap.xml files is considered to be a bad practice, as these pages will be crawled by search engines. Crawling outdated orphaned pages will waste your crawl budget. If an orphaned page in your sitemap.xml file has valuable content, we recommend that you link to it internally.

How to fix:

Review all orphaned pages in your sitemap.xml files and do either of the following:

- If a page is no longer needed, remove it
- If a page has valuable content and brings traffic to your website, link to it from another page on your website
- If a page serves a specific need and requires no internal linking, leave it as is

No HSTS support

Detailed Issue Description

About this issue:

HTTP Strict Transport Security (HSTS) informs web browsers that they can communicate with servers only through HTTPS connections. So, to ensure that you don't serve unsecured content to your audience, we recommend that you implement HSTS support.

How to fix:

Use a server that supports HSTS.

Llms.txt not found

Detailed Issue Description

About this issue:
The `<span style="font-style: italic">llms.txt</span>` file helps AI search engines better understand your website's content by providing LLM-friendly information. This file offers a short summary, guidance, and links to other useful resources.

How to fix:

- Create an `<span style="font-style: italic">llms.txt</span>` file.
- Place it in your website's root directory and ensure the file is accessible.
- Refer to llmstxt.org for examples and tips on how to properly create and manage it.
